TIMMY GRABLE

New York City, NY | grabletimmy@gmail.com | linkedin.com/in/timmygrable | github.com/timmygrable

Senior software engineer at Capital One with 4+ years of experience building backend systems in Python, Go, and TypeScript. Independently built and launched Saleio, a full-stack product with 100+ users, and Fed & Fit on the iOS App Store. Experienced in taking projects from an initial idea through architecture, implementation, and production support. Collegiate Athlete - Division II College Hockey Player

TECHNICAL SKILLS

- **Languages:** Go, Java, Python, TypeScript/JavaScript, SQL, C++, Swift
- **Backend & Frameworks:** FastAPI, Node.js, Express, SQLAlchemy, Next.js, React Native, SwiftUI
- **Cloud & Infrastructure:** AWS (Lambda, ECS Fargate, EC2, S3, EventBridge, SQS), Terraform, Docker, Kubernetes, PostgreSQL, Supabase

PROFESSIONAL EXPERIENCE

Capital One — Associate → Software Engineer → Senior Software Engineer — Cambridge, MA | Aug 2022 – Present

- Traced a misused library in the batch-job CPU-allocation path and rewrote the resource-allocation strategy, cutting $1.3M in annual cloud spend.
- Independently built and launched a company-wide AWS tagging engine that infers ownership from resource relationships and cross-region name matching; tagged 300K+ resources and is now maintained by a dedicated team.
- Led the post-acquisition cloud integration of Discover into Capital One's compliance standards via Wiz, building a connection that streams hourly and daily compliance reports for both cloud footprints against Capital One's cloud controls on an active-active batch architecture.
- Built a self-service deployment platform (Git -> Lambda -> ECS) that lets engineers author and ship configuration to any business unit or environment, 400+ deployments in production to date.
- Took over a stalled initiative and delivered an event-driven deployment system: Lambdas parse changes and roll out corresponding Lambdas and EventBridge rules across a multi-account, multi-region AWS environment, auto-requesting account-limit increases when ceilings are hit.
- Contributed AWS resource-support changes upstream to the Cloud Custodian open-source project.

Tyler Technologies — Software Engineer (Part-Time) — Falmouth, ME | May 2021 – Aug 2022

- Contributed to a full rewrite of an enterprise asset-management platform used by thousands of municipalities and corporations, migrating it from .NET to Genero BDL, ramping up on two new languages, including one with sparse public documentation, and rewriting large portions of the application.
- Brought on as a summer intern and asked to stay part-time through senior year, delivering production engineering work alongside a full CS course load and a varsity D-II hockey season.

PROJECTS

Saleio — Sales-outreach automation for X & Telegram (FastAPI · Next.js · AWS) — 2026 – Present

- Built and launched Saleio to 100+ users using FastAPI, Next.js, and AWS, with personalized outreach campaigns across X and Telegram, AI-powered reply triage, a unified inbox, and usage-based billing.
- Designed an adaptive polling system for X’s usage-priced API and limited message retrieval window, adjusting polling frequency to each account’s message volume to capture replies while controlling API costs.

Fed & Fit — Household pet-care app, iOS App Store (React Native · Express · serverless) — 2024 – 2026

- Designed and shipped a pet-care app to the App Store that lets a whole household share one care routine - feeding, medication, and walk schedules, with reminders that reach whoever's on duty.
- Built a serverless reminder engine using AWS Lambda, SQS, and push notifications, handling each user’s local time and retries to prevent duplicate reminders.

Deelio — Location-based nightlife app, 2,000+ users (React Native · Node.js) — 2022 – 2023

- Independently built and launched a nightlife app that attracted 2,000+ signups, with venue discovery, photo sharing, and meetup coordination using data from Foursquare and Google Maps.
- Built live-location sharing with trusted contacts and a Node.js/MongoDB backend on AWS, with encryption at rest, hashed credentials, automated tests, and CI.

EDUCATION

Stonehill College — B.S. Computer Science · Varsity Hockey — Easton, MA | May 2022
